

SEO, GEO & Search Console — Explained in Plain English

What we built, why it matters, and how to explain it to anyone. · NexDyne Consulting Group · July 19, 2026

The problem we started with

The website was a great store on a street with **no signs pointing to it** — and the signs that did exist pointed to the **wrong addresses** (old domains: newco . tech, nexdyne . tech). Google and AI tools either couldn't find the site properly or were being told it lived somewhere else.

1· SEO — getting found by search engines (Google, Bing)

Think of Google as a **librarian cataloging the internet**. We did four things so the librarian catalogs NexDyne correctly.

#	WHAT WE DID	PLAIN-ENGLISH MEANING
1	Fixed the address everywhere	Every page now declares its true home: nexdynegroup.com . Before, pages told Google "my real address is nexdyne.tech" — a domain we don't use.
2	Built a sitemap	A literal table of contents of all 1,116 pages , so Google doesn't have to stumble around discovering them one link at a time.
3	robots.txt	The "rules at the front door": who may come in, what to skip (/api/), and where the table of contents lives.
4	3 search-targeted articles	Written to match what customers actually type into Google: <i>"is my business ready for AI"</i> · <i>"what should a small business automate first"</i> · <i>"AI readiness checklist."</i> The article answers the search → ends with the free guide → the reader enters the funnel.

2· GEO — getting cited by AI (ChatGPT, Perplexity, Claude, Google AI answers)

The new game: more and more buyers don't Google — they **ask an AI**. The AI answers from what it has read, and cites sources. GEO makes sure that when someone asks *"how do I know if my business is ready for AI?"*, **the answer comes from NexDyne and mentions NexDyne**.

#	WHAT WE DID	PLAIN-ENGLISH MEANING
1	llms.txt	A briefing document written <i>specifically for AI systems</i> : who NexDyne is, what we believe (HIG™), our free tools, our key pages. A press kit for robots.
2	Structured data (schema)	Invisible machine-readable labels on pages: "this is an Organization named NexDyne, founded by David Seyaker, at this address" · "this is an FAQ " · "this is an Article ." AI systems trust labeled facts more than prose.
3	Opened the door ⚠	The big catch: Cloudflare was actively blocking every AI crawler (GPTBot, ClaudeBot, Perplexity's bot...). All the GEO work would have been useless with the door locked. We unblocked them — general bot defense stays on.
4	Citable content	The articles are written the way AI likes to quote: a direct answer in the first paragraph, real statistics with named sources, clean definitions.

3· Google Search Console — what is it for?

GSC is **Google's free control panel for website owners** — the only official way to talk to Google about your site.

What we did there:

- ✓ **Verified ownership** of nexdynegroup.com (auto-passed via Google Workspace)
- ✓ **Handed Google the sitemap** — all **1,116 pages accepted on the spot**

What it's for going forward — the scoreboard. In a few weeks it will show: which pages Google has **indexed** · **what searches people typed** when the site appeared · how many **clicked**. That's how we'll know the articles are ranking — real data, not guessing.

The one-sentence version

SEO makes Google recommend you. **GEO makes AI assistants recommend you.** Search Console is the dashboard where you watch it happening — and all roads lead to the free guides, which capture the lead and start the machine.

Expectation setting

Nothing here pays off overnight — search and AI visibility **compound over weeks and months**. But the plumbing is now correct, the doors are open, and the meter is running.

How it connects to the funnel
